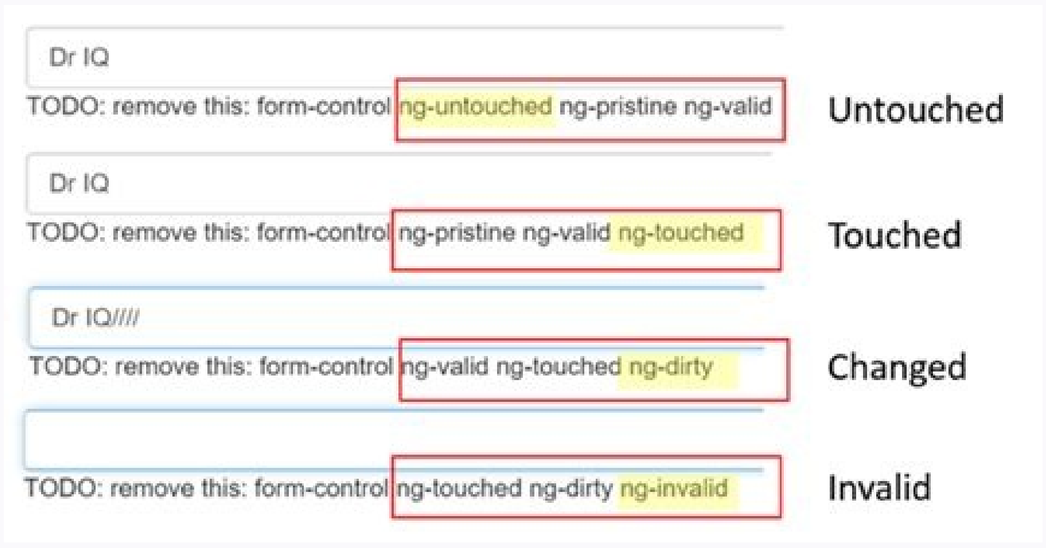
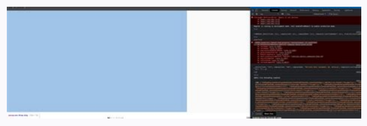
Template reference variable in angular 8





```
"styles": [
        "src/styles.scss",
         "node_modules/medium-editor/dist/css/medium-editor.min.css",
         "node_modules/medium-editor/dist/css/themes/default.css"
      ],
      "scripts":
["node_modules/medium-editor/dist/js/medium-editor.min.js"]
```

Template reference variable in angular 8 stackblitz. Template reference variable in angular 8 example. How to use template reference variable in angular 8.

Make Make sure that you only attempt to use these variables within the ngAfterViewInit lifecycle hook or after this hook completes!For more information on the ElementRef type, check out the Angular documentation.Accessing underlying HTML elements in your Angular templates is great, but what if you want to access child components within your template? Directive with exportAsA directive can have an exportAs property applied to its metadata to allow that directive to be specifically targeted by a template reference variable.2. ComponentThere can only ever be one component per html element. They are declared like this#baseToggle or this #myToggle="toggle". In the sections that follow, you will learn what template reference variables are and how you can use them in your Angular components and services to gain low-level, manual control over the template elements that you are referencing.To get started using template reference variables, simply create a new Angular component or visit an existing one. But what do you do when you need to directly access an HTML element on the DOM in a manner that is type-safe?Angular's template reference variables provide a useful API through which you can interact with DOM elements and child components directly in your Angular code. For HTML elements, use the ViewChild decorator to create a new ElementRef as shown below:1 @ViewChild('myTestDiv') myTestDiv: ElementRef;This ElementRef gives your component direct access to the underlying HTML element when you use its nativeElement field like this:1 const divEl: HTMLDivElement = this.myTestDiv.nativeElement;Warning: Template reference variables will remain null/undefined until the view portion of the component has finished initiating. JavaScript frameworks like Angular provide great abstractions and useful APIs on top of the native Document Object Model (DOM) that can make your codebase more readable, maintainable, and efficient.
